Custom Development

As a leading Microsoft Gold Certified Partner, Northridge Systems exclusively leverages the Microsoft platform and Visual Studio 2005 for all software and web development initiatives. By focusing our time and effort on a single development platform, we have built deep expertise and have authored a robust and comprehensive source code library. This source code library includes hundreds of tested and proven modules that enable us to deliver effective and reliable custom development solutions at a significantly lower cost.

Custom Development Services:

❖ Windows Application Development

While a large number of software development initiatives have moved to a web-based model, there are still many cases in which a traditional Windows application is appropriate. Our software development team delivers robust and full-featured Windows applications ranging from large-scale line-of-business systems to shrink-wrapped consumer products. By following a detailed development methodology and industry standard best practices, we deliver projects on-time and on-budget while meeting or exceeding all customer expectations.

❖ Website and Web Application Development

There are tremendous advantages to a web-based model for software development and distribution, not the least of which is a single deployment to support and maintain. Northridge Systems has delivered hundreds of mission-critical web-based software initiatives for customers throughout the United States. Our team possesses the diverse set of capabilities, ranging from interface design to software engineering, that are critical to driving successful website solutions.

❖ SharePoint Development

Microsoft Office SharePoint Server 2007 provides an integrated suite of server capabilities for enterprise search, content management, business process facilitation, simplified information sharing, and enhanced business insight. Northridge Systems leverages its strong foundation with the .NET framework, ASP.NET and SQL Server 2005 to build highly customized and functional enterprise portal solutions based on SharePoint Server 2007.

❖ Website Content Management

While there are many types of websites on the Internet today, the most common type is still the company website focused on marketing products and services. These types of websites are "owned" by the marketing department within an organization but often times the marketing personnel do not have the technical expertise to update and manage the website. Northridge Systems offers a workflow-based Content Management System (CMS) that provides visual site management capabilities and allows non-technical personnel to fully manage and extend a corporate website.

Technologies

Northridge Systems leverages the following technologies within its Custom Development practice:

- .NET Framework 3.0
- Visual Studio
- SQL Server 2005
- ASP.NET and ADO.NET
- SharePoint Server 2007
- HTML/DHTML/CSS
- BizTalk Server
- Windows Mobile
- Web Services
- Microsoft Office 2007
